

Planting your *Erythronium* Bulbs

The bulbs you receive should be planted as soon as you are able to and kept moist at all times. Most will flower during the Spring following planting, the odd one may take a year longer.

Most *Erythronium* bulbs have an obvious tip which may still have the leaf sheath attached and this is the top of the bulb. The base is rounded, and often creamy-white and smooth. Please be aware that roots often appear on the side of the bulb rather than from the bottom.

How to plant

Make a hole that is twice the length of the bulb and place it at the bottom of the hole. Ensure that the bulb is kept upright and gently back fill with soil and firm into position.

Planting in Pots

Use well drained compost with plenty of organic matter. Potting compost with some grit, perlite or bark added to open up the compost works well.

Plant in deep pots if possible – the bulbs, once planted, will work their way deeper in time. Keep the compost damp and roots will develop in late summer / autumn and leaves appear from early March onwards. Protect from slugs and keep in a cool shady place. Protect from frost with fleece or similar.

Planting in open garden

Erythronium in the wild often grow where it is cool with light dappled shade. Prepare soil well with added organic matter. Old compost or leaf mould is ideal as an additive. Apply surface mulch of organic material and protect from slugs from late February onwards.

Your bulbs are carefully packaged in recycled, oxo-biodegradable bags. These are reusable and recyclable.
